Subject: Feedback

Hi

Thank you for the opportunity to provide feedback on the proposed methods for mandatory reporting under the Waste Avoidance and Resource Recovery Regulations 2008.

1. Are the proposed material categories practical and appropriate for local governments? **Yes the proposed categories are appropriate, although we may not see large quantities of ferrous and nonferrous metals it is still appropriate to include these.**
2. Is the annual Local Government Waste and Recycling Census template an appropriate reporting template? **Yes the Waste and Recycling Census is an appropriate template to use it provides good data for use in other reporting and Local governments are familiar with it.**
3. Are the proposed calculation methods to estimate the weight of waste received, disposed, leaving and stockpiled at your site clear? If not, what further clarification is required? **Yes these calculation methods are clear**
4. Are there any barriers that would prevent your organisation from using these calculation methods? If so, what are they and how can they be overcome? **No there are no barriers to prevent our organisation from using these calculation methods.**
5. Are the proposed default material densities and other default values appropriate for Western Australian local governments? **Yes the proposed default materials are appropriate, although the assumed weights for mixed waste per vehicle type are higher than expected?**
6. Are the proposed special provisions suitable for smaller local governments? **The proposed special provision for smaller Local governments are suitable although all Local governments, irrespective of population size should be required to report actual Waste generation rates to ensure transparency and equity across the sector.**

With Regards
