Application to amend L4247/1991/13 to include Category 61 – Storage and treatment of liquid waste from the Port of Bunbury

Thanks for your and your team's time on Thursday 7 August 2025. As discussed, Talison Lithium Australia (**Talison**) is submitting an urgent application to amend Licence L4247/1991/13 to include Category 61. The purpose of this amendment is to authorise storage and treatment at the Talison Lithium Mine of liquid waste drained and collected from the ore stockpile at our Port of Bunbury bulk handling facility. Treatment of this waste has been ongoing for many years, Talison having formed an opinion that it was not a controlled waste as the original source was Talison's Prescribed Premises.

The elevated metals within the waste liquid are naturally occurring and leach from ore and concentrate during processing and handling. They are returned to the Mine Water Circuit (the subject liquid waste is transported from port to site by truck) where they are treated by the Water Treatment Plant and Arsenic Remediation Unit, with potential impacts managed by previously assessed and approved controls and monitoring.

on 6 August 2025 and it was agreed that urgent amendment of the Licence is the appropriate path forward. I have submitted the amendment application today, 8 August 2025. Please don't hesitate to contact me with any comments or queries regarding this matter; I look forward to your response and feedback at your earliest convenience.
