1. Decision summary

This Amendment Report documents the assessment of potential risks to the environment and public health from proposed changes to the emissions and discharges during the operation of the Premises. As a result of this assessment, Revised Licence L9426/2024/1 has been granted.

2. Scope of assessment

2.1 Regulatory framework

In completing the assessment documented in this decision report, the Department of Water and Environmental Regulation (the department; DWER) has considered and given due regard to its regulatory framework and relevant policy documents which are available at <https://dwer.wa.gov.au/regulatory-documents>.

2.2 Application summary and overview of premises

Perdaman Chemicals and Fertiliser Pty Ltd (the Licence Holder) is developing a urea production facility (Project Ceres) on the Burrup Peninsula (Figure 1) approximately 9km north-east of Dampier. The Licence Holder currently holds a licence (L9426/2024/1) for Category 12 activities (Screening, etc. of material) to support construction of Project Ceres. On 3 April 2025, the Licence Holder submitted an application to amend Licence L9426/2024/1 under section 59 and 59B of the *Environmental Protection Act 1986* (EP Act).

This amendment is limited only to changes to Category 12 activities on the Existing Licence.

Table 1 below outlines the proposed changes to the existing Licence.

Table 1: Proposed throughput capacity changes

Category	Current throughput capacity	Proposed throughput capacity	Description of proposed amendment
12	1,300,000 tonnes per year <i>5,000 tonnes per day</i>	No change	The Licence Holder has requested authorisation to operate a second crushing and screening circuit to achieve the nominated daily throughput of 5,000 tonnes. This will facilitate the completion of site works associated with construction of Project Ceres by 31 July 2025.

2.2.1 Background

The crushing and screening activities authorised by the licence initially commenced in November 2023 under Works Approval W6630/2021/1 for the construction of the broader Perdaman Urea Production facility – Project Ceres. These bulk earthworks involve using the processed material to level the site in preparation for the construction of this facility and for pavement materials for site works. The materials being processed includes virgin material excavated from the Sites C and F (Figure 1), processed treated acid sulphate soil materials and sand dunes.

Initially, three crushing and screening plants were authorised to operate at the premises (two at Site C and one at Site F), however, the number of operational plant has reduced as construction works have progressed. The Licence currently authorises the operation of a single crushing and screening circuit at Site F, allowing a total production throughput of 1,300,000 tonnes per year.

2.2.2 Works Approval W6630/2021/1

Works approval W6630/2021/1 was granted on 14 July 2022 and authorised the installation and time-limited operations of crushing and screening plant for a total design capacity of 450,000 tonnes per annum (tpa).

Appeal 028/22

Following the granting of the works approval, appeals were lodged that opposed the conditions of the works approval on the basis that the conditions do not adequately protect the rock art in the surrounding environment which the appellants contended has significance at State, national and international level.

On 1 November 2023, the Minister determined to allow the appeal in part, with additional requirements imposed that clarified the use of dust control equipment, and introduced buffers from heritage sites to further reduce potential impacts from crushing and screening activities.

2.2.3 Licence L9426/2024/1

Licence L9426/2024/1 was granted 19 March 2024 and provided for the transition of completed works under Works Approval W6630/2021/1 to a licence. The Licence authorised operation of multiple crushing and screening circuits across both Site C and Site F. The Department's risk assessment and subsequent granting of the licence for the Premises took into consideration the appeal outcomes for W6630/2021/1.

Appeal 016/24

The conditions of Licence L9426/2024/1 were also appealed, with the grounds of appeal being similar to those lodged against W6630/2021/1. The Minister's determination of the appeal on 21 November 2024 allowed the appeal in part, with an additional condition imposed requiring cessation of crushing and screening activities by 31 July 2025. The licence was amended on 3 December 2024 to give effect to the Minister's decision. The decision did not alter the authorised daily throughput for Category 12 activities which remained at 5,000 tonnes per day.

Amendment – March 2025

The Licence was amended in March 2025 to increase the allowed annual throughput for Category 12 activities from 850,000 tonnes per annum to 1,300,000 tonnes per annum. No change was made to the daily throughput of 5,000 tonnes per day with the increased throughput directly associated with an extension to duration of works. Noting that crushing and screening activities were no longer being undertaken at Site C, infrastructure associated with Site C operations was removed from the Licence.

Compliance

Under the Licence the Licence Holder is obligated to submit an Annual Environmental Report (AER) and Annual Audit Compliance Report (AACR) each year for the previous reporting period. The AER provides annual throughput tonnages, air quality monitoring data as well as a summary of complaints and any dust management trigger exceedances. The AACR is a self-auditing tool requiring review of compliance against licence conditions.

The AER and AACR for the 2023 – 2024 reporting period were received by the department on 30 July 2024. This is the first AER and AACR submission required since the commencement of the licence in March 2024.

In its AACR, the Licence Holder declared non-compliance with conditions relating to monitoring of dust, indicating that the monitoring network was not properly established at the commencement of the licence. It was noted that monitors were either not installed on time or were initially recording an incorrect averaging period (i.e. 15-min average rather than 10-min average). Information provided by the Licence Holder indicates that issues with dust monitoring equipment has been rectified and the systems are operating as required by the Licence.

Review of the AER and AACR is ongoing. Declared non-compliance matters are being investigated and will be addressed in accordance with the department's *Compliance and Enforcement Policy* (2021).

2.2.4 Application to amend the licence

The application requests the operation of a second crushing and screening circuit equivalent to that currently operated at the premises.

Per the Minister's decision on Appeal 016/24, crushing and screening activities at the premises must cease by 31 July 2025. Information provided by the Licence Holder indicates that approximately 482,000 tonnes of material remains in stockpiles at the premises requiring processing through the crushing and screening plant. According to the Licence Holder, current activities onsite demonstrate that a single crusher can only maintain an average production of 2,500 – 3,500 tonnes per day, which is not sufficient to process the remaining stockpiled material by the required completion date. The Licence Holder has advised that a throughput of 5,000 tonnes per day must be maintained in order to complete crushing and screening works by the Minister's imposed cessation date. To achieve this, the Licence Holder has indicated that a second crushing and screening circuit is required to operate on the premises at Site F.

Operation of the second crushing unit will not alter the daily throughput volume which remains at 5,000 tonnes per day, nor will it result in any change to the total annual throughput of 1,300,000 tonnes.

2.2.5 Operation

The Licence currently authorises crushing and screening activities at Site F using the infrastructure and equipment listed in Table 2. Additional crushing and screening equipment proposed to be operated at the premises will replicate that already authorised as shown in Table 2.

Back-up equipment is also authorised to be present onsite to allow continued operations. Back-up equipment will continue to be situated on the premises, ready to be mobilised to replace equipment listed in Table 2 that is offline for maintenance, repairs etc. No change to the back-up equipment is proposed as part of this amendment application.

Crushing and screening works will continue to be limited to Site F only. The new infrastructure will be fitted with the same dust control equipment such as dust sprays and hoods, and the same operational controls associated with crushing and screening activities will apply (refer to section 4.1.1). Existing infrastructure will continue to operate in accordance with the requirements of the Licence with no change to operational controls proposed.

Table 2: Equipment authorised and proposed to be operated at Site F.

Current equipment authorised at Site F	Proposed additional equipment at Site F
<ul style="list-style-type: none"> • 1 x Jaw crusher; • 1 x Secondary cone crusher; • 1 x Incline screen; • 1 x Track mounted stacker; • 1 x Excavator (loading tool or equivalent); • 1 x Loader; • 1 x Dust suppression water tank, with a generator 	<ul style="list-style-type: none"> • 1 x Jaw crusher; • 1 x Secondary cone crusher; • 1 x Incline screen; • 1 x Track mounted stacker; • 1 x Excavator (loading tool or equivalent) • 1 x Dust suppression water tank, with a generator

Schedule:

Information provided by the Licence Holder indicates that operation of the additional crushing

and screening plant will commence on 1 June 2025. Noting the outcome of Appeal 016/24 (section 2.2.3), which requires that crushing and screening works are to cease on 31 July 2025, the additional crushing and screening equipment is expected to operate for short term period of only 2 months.

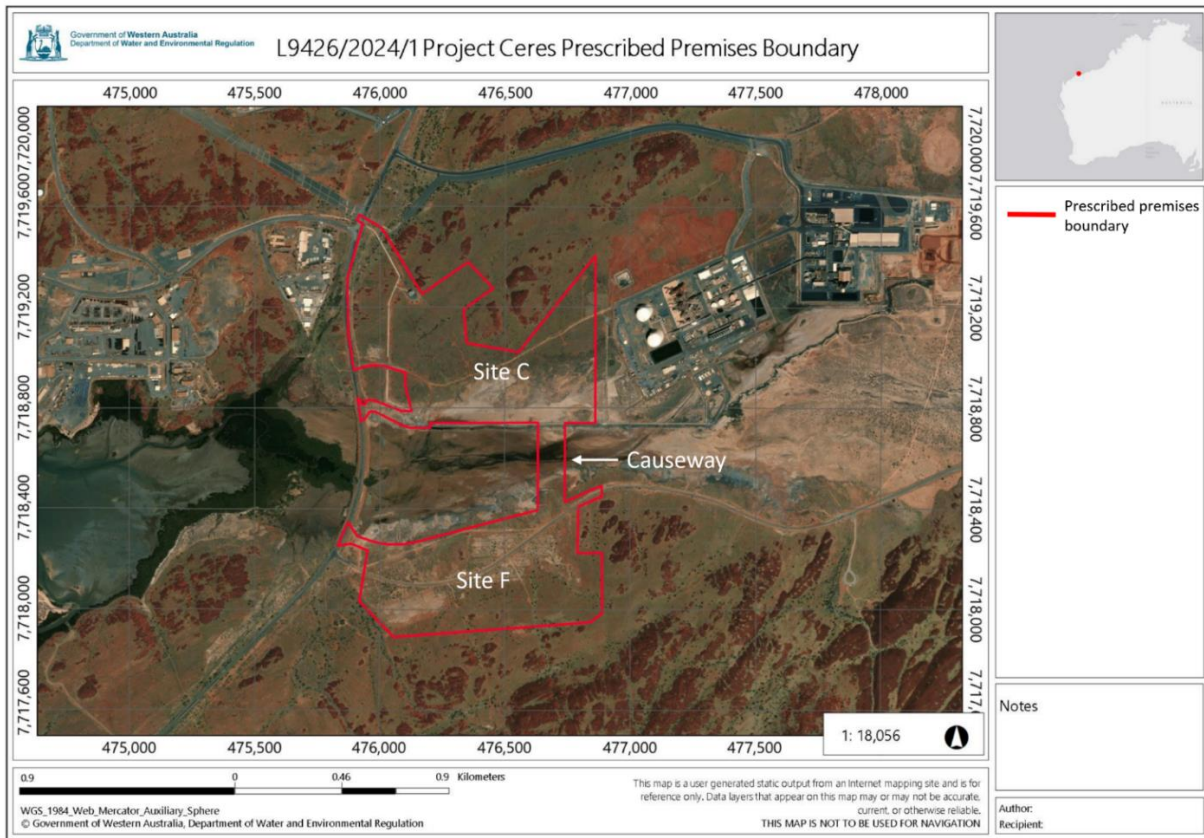

Figure 1: Perdaman Urea Project – Prescribed premises boundary

2.3 Premises environmental siting

2.3.1 Disturbance footprint

Crushing and screening activities are associated with site preparation works for the construction of the Perdaman Urea Facility (assessed under W6875/2023/1 granted on 25 June 2024). Figure 2 and Figure 3 demonstrate the proposed cut and fill area and provides a general extent of where material will be sourced for crushing and screening purposes. The Delegated Officer notes the Licence Holder's approach is to avoid areas that have a high likelihood for acid sulphate soils (ASS).

The Licence Holder has indicated that some ASS have been intercepted during construction works. Where ASS are intercepted, they are managed in accordance with conditions of MS 1180 (conditions 7-1 and 7-2 relating to ASS, and the approved Surface Water Management Plan). This includes treatment of material per the department's guideline on the *Treatment and management of soil and water in acid sulfate soil landscapes* (DER, 2015) prior to processing via crushing and screening equipment.

In its assessment of the Licence granted in March 2024, the department considered the results of a detailed site assessment and the potential risks associated with disturbing ASS and soils contaminated with other material such as PFAS. The department also had regard for conditions of MS 1180 relating to the management of ASS. Based on the information available, the department concluded that there was a low risk of introducing contaminated feed material into the crushing and screening circuit and that ASS were most appropriately regulated under Part

IV of the EP Act via conditions of the Ministerial Statement (MS 1180). Details of this assessment are documented in the relevant Decision Report which is available online at www.der.wa.gov.au.

The Licence Holder proposes no change to the proposed cut and fill areas. Noting this and the requirements of MS 1180 with regards to managing and treating ASS, the Delegated Officer determined that there is no change to the risks associated with introducing contaminated feed into the crushing and screening equipment as a result of this amendment.

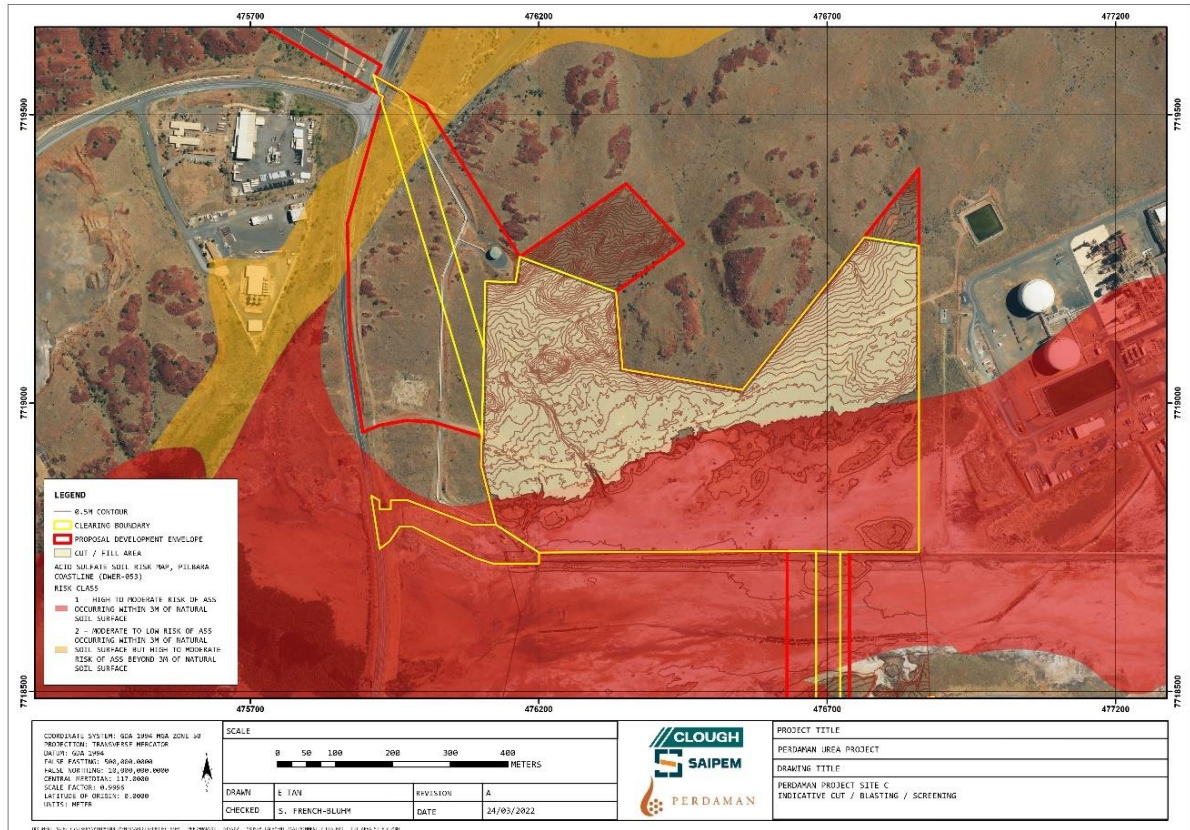

Figure 2: Proposed cut and fill locations for Site C

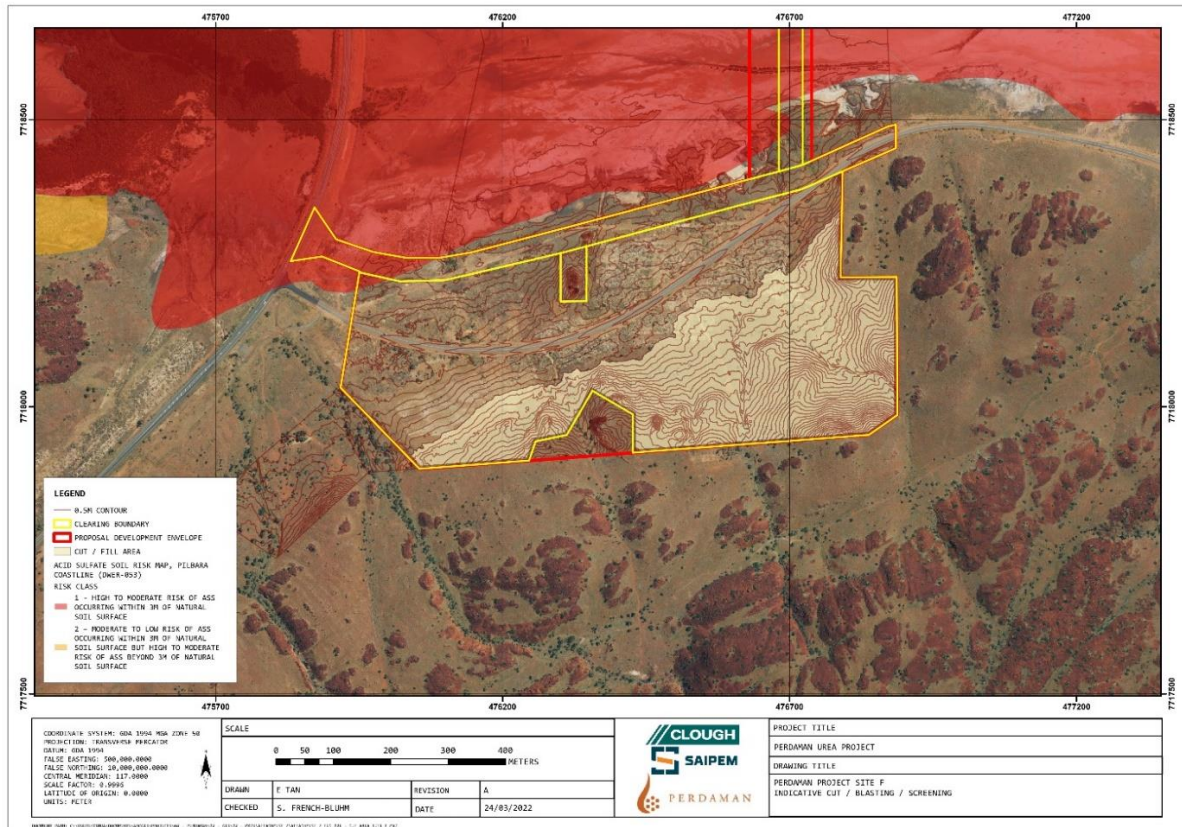

Figure 3: Proposed cut and fill locations for Site F

2.3.2 Ambient air quality and regional influences

The Burrup Peninsula is a semi-arid climate of generally hot summers with period heavy rains and mild winters with occasional rainfall. Tropical cyclones can occur between the months of December and April.

The wind conditions for the area are characterised by prevailing easterlies during the dry season between April and August and westerlies during the wet season between October and February (Figure 4).

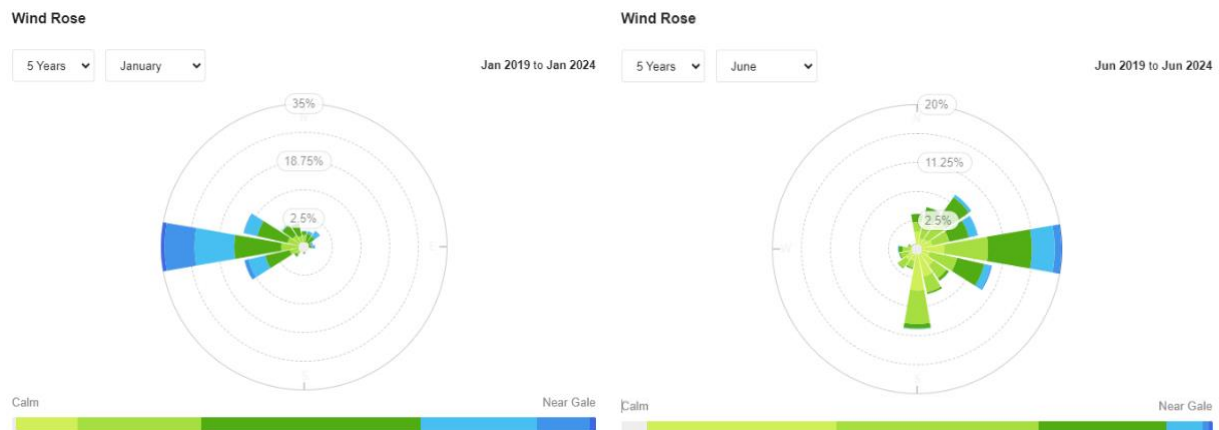

Figure 4: Wind roses of prevailing winds from Karratha Airport for summer and winter months

2.3.3 Dust monitoring

The existing Licence requires the Licence Holder to carry out ambient monitoring for dust (PM₁₀ and PM_{2.5}) at four fixed locations around the boundary of the premises (Figure 5). The Licence Holder is also required to monitor dust using a portable monitor that can be relocated depending on the location of the crushing and screening equipment in relation to the nearest cultural heritage sites (as identified in the Cultural Heritage Management Plan and shown in Figure 6 below) and taking into consideration prevailing wind conditions for the purpose of detecting dust emissions from crushing and screening activities. A management trigger is specified on the Licence to inform onsite personnel of elevated dust levels to ensure that appropriate mitigation measures are being implemented to minimise dust from the premises.

The AER submitted in July 2024, indicates that there were 51 instances where the dust management trigger was exceeded during the 2023/2024 reporting period. The Licence Holder indicated that these trigger events were generally associated with other construction activities such as ripping, loading and hauling, rather than directly attributable to crushing and screening.

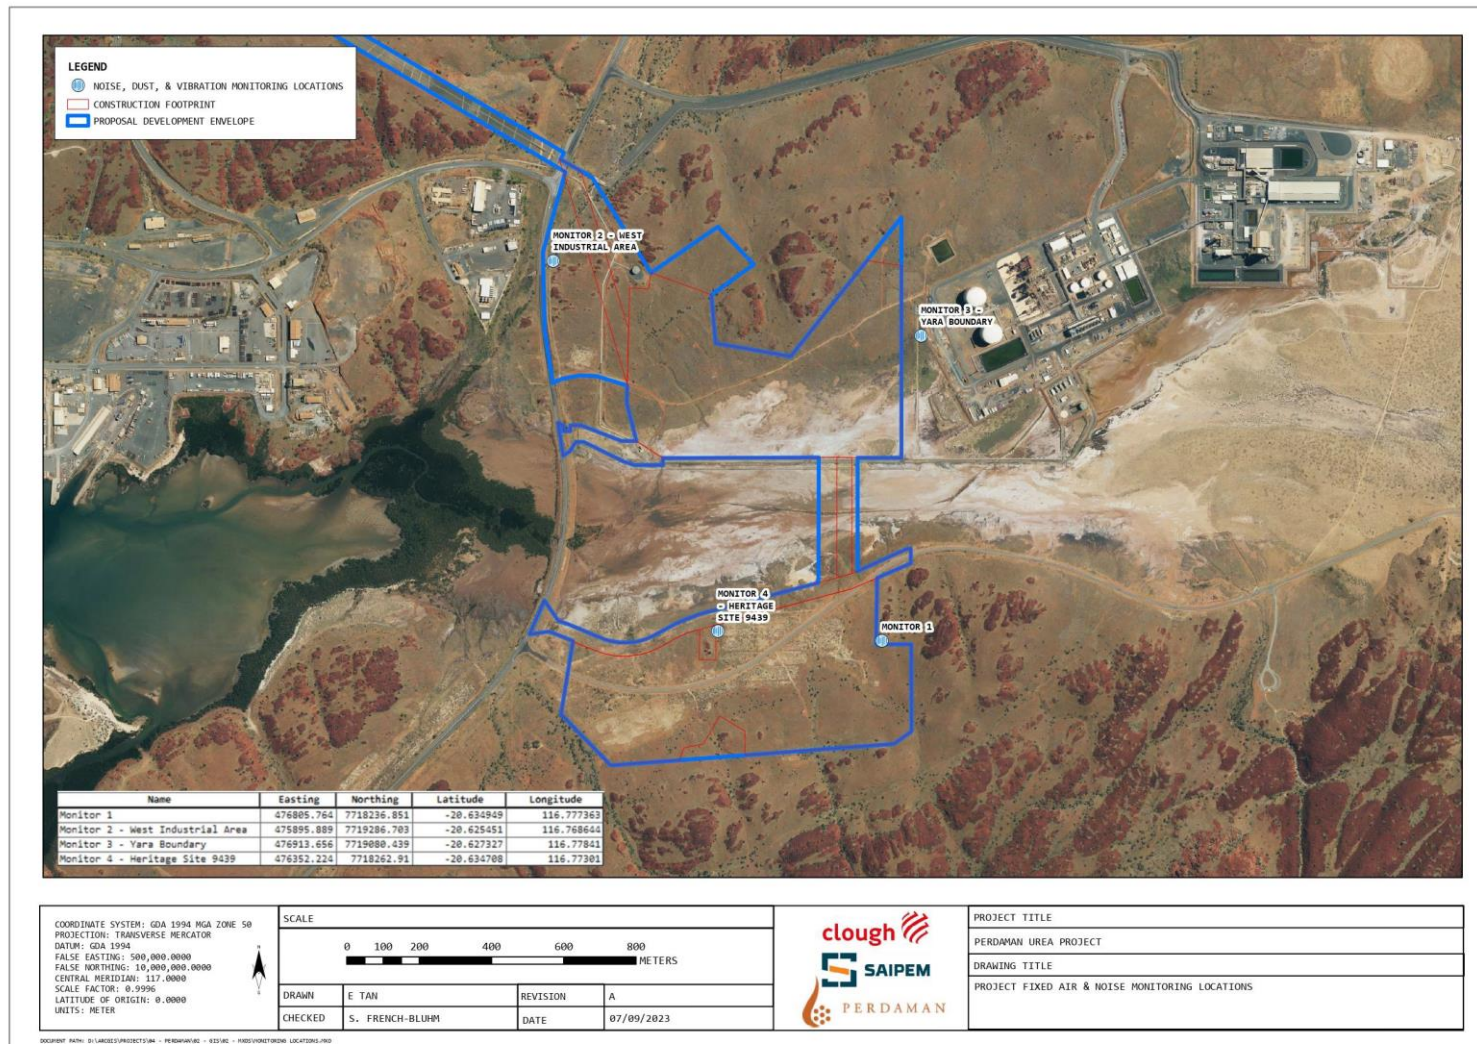

Figure 5: Map of current fixed dust monitoring locations

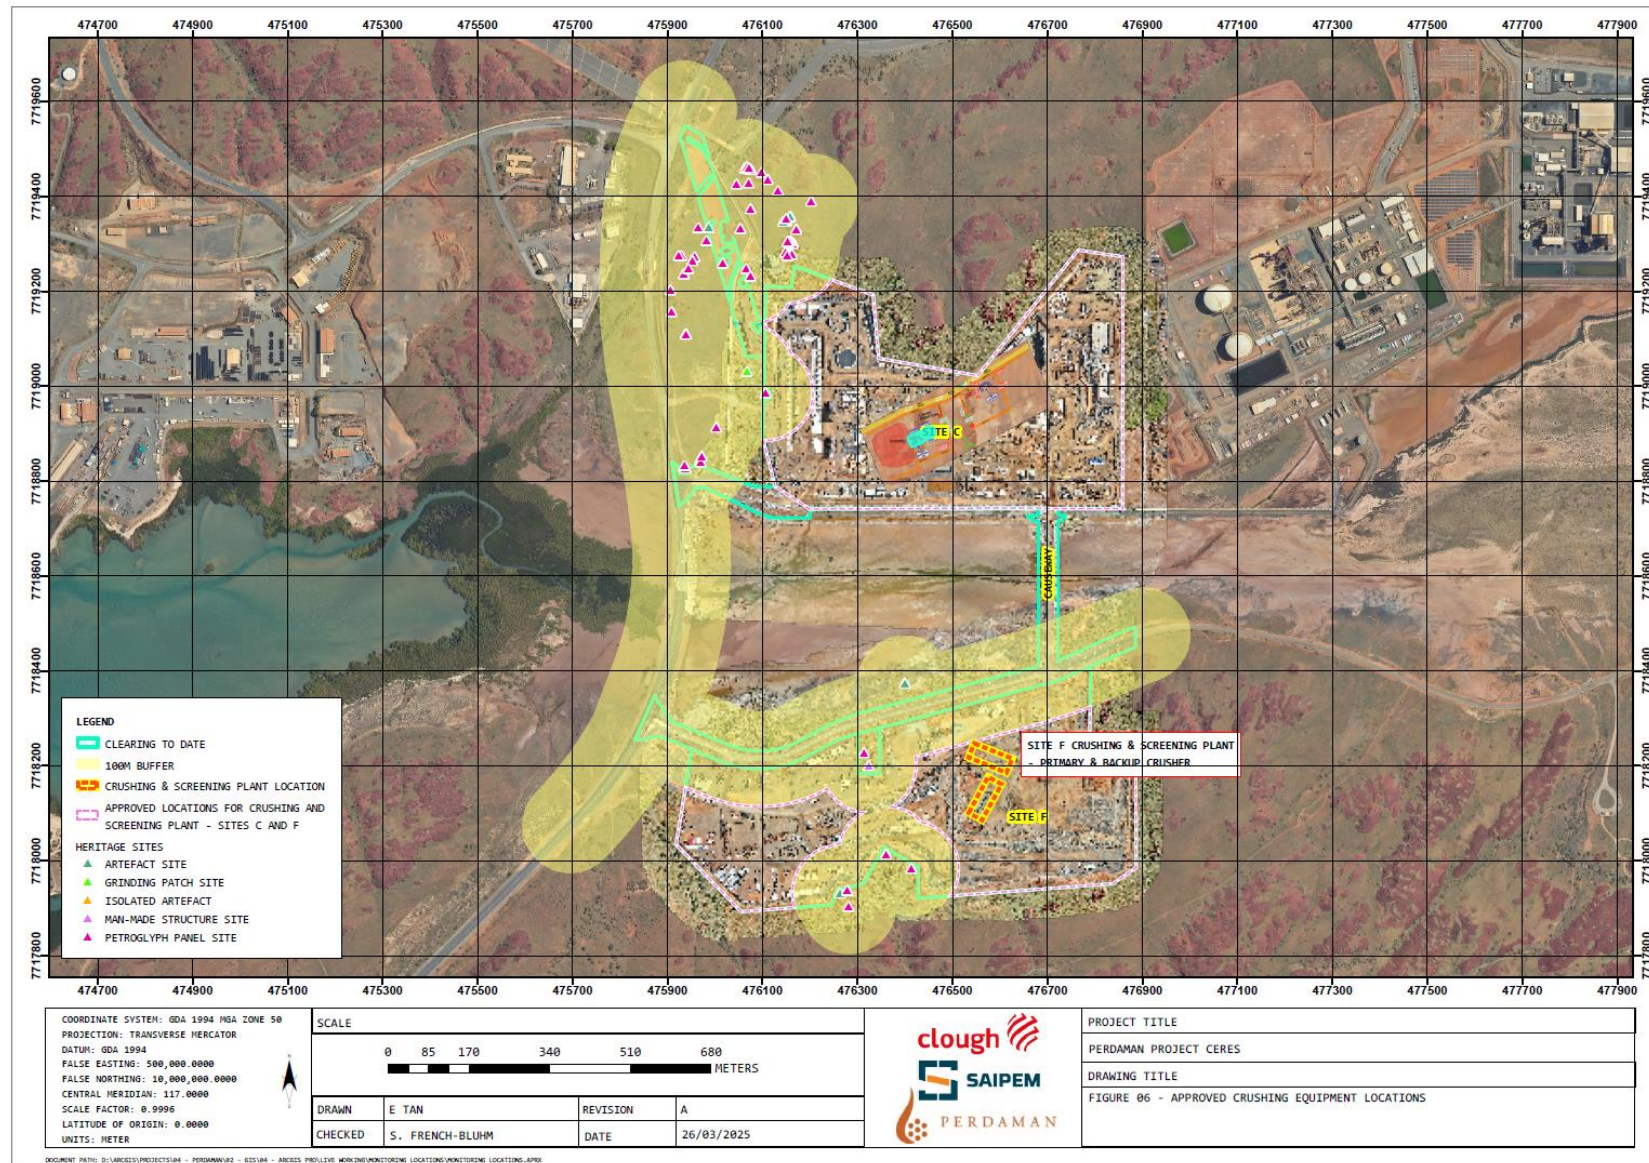

Figure 6: Heritage locations defined within the approved Cultural Heritage Management Plan.

3. Legislative context and other approvals

Table 3 below provides a summary of relevant approvals for the premises and assessment.

Table 3: Relevant Approvals and Tenure

Legislation	Details
Development Approval	<p>The Development Approval DA21261 was granted in accordance with regulation 8 of the <i>Planning and Development (Development Assessment Panels) Regulation 2011</i> on 15 March 2022.</p> <p>The DA specify that the applicant is required to implement dust management measures during construction and operation and plans under any other relevant legislation and/or approvals.</p>
<i>Environmental Protection and Biodiversity Conservation Act 1999</i>	<p>This proposal was referred under the EPBC Act and determined to be a controlled action (EPBC 2018/8383) pursuant of section 75 of the EPBC Act. The action assessed involved the construction and operation of the urea plant and associated infrastructure. The controlling provisions are section 15B and 15C (national heritage values of a national heritage place), section 18 & 18A (threatened species and communities), section 20 & 20A (migratory species) and section 23 & 24A (Commonwealth marine area). The decision to approve the action passed on 26 February 2022.</p>
<i>Aboriginal Heritage Act 1972</i>	<p>This proposal has consent under section 18 of the <i>Aboriginal Heritage Act 1972</i> issued on 27 January 2022.</p>
<i>Biodiversity Conservation Act 2016</i>	<p>Authorisation to take or disturb threatened species under section 40 of the <i>Biodiversity Conservation Act 2016</i> for the purpose of taking threatened fauna in a management operation to facilitate the construction and operation of a urea production plan and associated activities. This was originally approved on 28 June 2023.</p>
Part IV of the <i>Environmental Protection Act 1986</i>	<p>Ministerial Statement 1180 (discussed further below).</p>
Part V of the <i>Environmental Protection Act 1986</i>	<p>Works Approval W6630/2021/1 for Category 12 activities granted 14 July 2022</p> <p>Licence L9426/2024/1 for Category 12 activities granted on 3 December 2024.</p>
<i>Rights in Water and Irrigation Act 1914</i>	<p>S17 Permit to Obstruct or Interfere (approval PMB209045(1)), granted 21 August 2023 for the construction of a causeway to provide access between Site C and Site F of the Perdaman Urea Project.</p>

3.1 Part IV of the EP Act

The Perdaman Urea Project was referred to Environmental Protection Authority (EPA) under section 38 of the EP Act on 7 May 2018 and was assessed (Assessment No: 2184) at the level of Public Environmental Review (PER). The EPA released its report and recommendation on the project (EPA Report 1705) on 1 September 2021. The Ministerial Statement (MS) 1180 was

published on 24 January 2022.

The approved proposal authorised the construction and operation of a urea production plant with a nominal production capacity of about 2 million tonnes per annum (Mtpa) within Development Envelopes named Site C and Site F, located within the Burrup Strategic Industrial Area (BSIA) on the Burrup Peninsula.

MS 1180 was granted with the requirements that revised management plans (under Conditions 3-3, 4-3, 5-3, 7-2, 8-2, 9-2 and 10-2) and supplementary studies (under condition 6-3 and 7-1) must be submitted at least six months prior to ground disturbing activities and that the proponent must not undertake the commencement of ground disturbing activities until the CEO has confirmed in writing that the management plans have been revised and satisfy the requirements of those conditions.

On 6 July 2022, the applicant received final notification from the EPA that it had complied with the requirements in accordance with the Part IV approval (MS1180) for the management plans required at least 6 months prior to Ground Disturbing Activities.

Table 4 details the key environmental factors that were considered during the Part IV assessment and conditioned through the MS 1180, including specific requirements from the various management plans, that are relevant to the scope of this licence amendment application.

Table 4: EP Act Part IV assessment relevant to the assessment of Category 12 activities

Environmental factor	Summary of Part IV assessment related to this proposal
Air quality (Conditions 2-1 to 2-10)	Conditions of MS1180 require that no air emissions from the proposal have an adverse impact accelerating the weathering of rock art within Murujuga beyond natural rates. Air emissions from the overall urea plant proposal are required to be managed in accordance with an Air Quality Management Plan (as required by condition 2-3 of MS1180). Further, the applicant has developed a Construction Environmental Management Plan (CEMP) Air Quality Management Protocol (discussed further in Table 4) to supplement their confirmed Cultural Heritage Management Plan (required by MS1180 conditions).
Cultural heritage (Conditions 9-1 to 9-8)	<p>Conditions of MS1180 require that the implementation of the proposal achieves the following outcomes:</p> <ul style="list-style-type: none"> • avoid, where possible, and otherwise minimise direct and indirect impacts to social, cultural, heritage and archaeological values within and surrounding the development envelope; • allow ongoing Traditional Owner and Custodian access to enable traditional activities and connection to culturally significant areas within and surrounding the development area; and • avoid, where possible, and otherwise minimise direct and indirect impacts to visual and amenity impacts to social and cultural places and activities. <p>The applicant has a confirmed Cultural Heritage Management Plan to meet the objectives specified in condition 9-1 and to the requirements of condition 9-2. Relevant requirements from this management plan relating to the control of dust emissions include:</p> <ul style="list-style-type: none"> • construction equipment will be checked to ensure is in good condition; • machines to be operated at low speeds where practical and will be switched off when not being used rather than left idling for prolonged periods; • minimise vehicle speeds on and around work sites to be reduced where necessary to minimise dust emissions;

	<ul style="list-style-type: none"> dust suppression techniques used on unsealed roads and access tracks; and avoiding earthworks during high winds (>40km/hr). <p>Requirements found to be specific to impacts to rock art are:</p> <ul style="list-style-type: none"> undertake monitoring during construction and commissioning; and adopt future environmental air quality objectives and standards derived from the results of the Murujuga Rock Art Monitoring Program. <p>Relevant requirements from this management plan to control noise emissions include:</p> <ul style="list-style-type: none"> machines found to produce excessive noise compared to industry best practice will be removed from the site or stood down until repairs or modifications can be made. <p>The management plan also includes the following commitments to management impacts to cultural heritage sites and value:</p> <ul style="list-style-type: none"> lighting will be designed to reduce light spills. <p>Revisions of management plans for key environmental factors specified in MS 1180 are required to be made in consultation with the Murujuga Aboriginal Corporation to ensure heritage and cultural values are continued to be considered in a holistic way.</p>
<p>Terrestrial flora and vegetation</p> <p>(Conditions 4-1 to 4-9)</p>	<p>Conditions of MS1180 contain restrictions on the extent of clearing to meet the following environmental outcomes:</p> <ol style="list-style-type: none"> (1) the extent of native vegetation clearing within the development envelope shall not exceed 73.05ha; and (2) the extent of clearing within the vegetation community identified as Priority 1 (P1) Priority Ecological Community (PEC) – Burrup Peninsula Rock Pile Communities shall not exceed 0.16ha <p>and to minimise indirect impacts to native vegetation.</p> <p>It is noted that the crushing and screening activities are to occur only with the approved clearing extent.</p> <p>The applicant has a confirmed Flora Management Plan submitted under condition 4-3 that satisfies the requirements of condition 4-7 including provisions relevant to managing impacts from crushing and screening activities such as impacts to native vegetation from changes to surface water flows, changes to surface water quality and dust.</p> <p>The Flora Management Plan also involves the requirements for:</p> <ul style="list-style-type: none"> visual monitoring for signs of vegetation stress from dust emissions; implementation of dust suppression on unsealed roads and access roads, when there is visible dust (except during topsoil stripping); implementation of controls relevant to dust in the CEMP Air Quality Management Protocol; and inspections regarding dust emissions. <p>During the assessment for works approval W6630/2021/1, the department's EPA Services directorate confirmed that specific requirements of MS1180 will manage dust impacts on terrestrial flora as the confirmed plans discussed above will include management controls that include the proposed crushing and screening activities, provided they are undertaken within the approved disturbance footprint of the proposal.</p>

<p>Terrestrial fauna (Condition 5-1 to 5-8)</p>	<p>The conditions of MS1180 restrict the applicant from clearing specific vegetation species that may provide habitat to fauna and further impacts to short-range endemic fauna species are to be avoided where possible. The environmental objective specified in the MS is to minimise direct and indirect impacts to the northern quoll, Pilbara olive python and ghost bat within the development envelope (which involves the spatial scope of this application).</p> <p>The applicant is required to implement their confirmed Fauna Management Plan and a Threatened Species Management Plan that satisfies the requirements of condition 5-3 including the management of impacts from lighting, dust, noise, vibration, and vehicle and machinery movement strikes.</p> <p>During the assessment for works approval W6630/2021/1, the department's EPA Services directorate confirmed that specific requirements of the MS will manage dust impacts on terrestrial fauna as the confirmed plans discussed above will include management controls that include the proposed crushing and screening activities, provided they are undertaken within the approved disturbance footprint of the proposal.</p> <p>The activities associated with the crushing and screening (as under consideration within this licence amendment application) do not include any further clearing.</p>
<p>Acid sulfate soils (ASS) (Condition 7-1 and 7-2)</p>	<p>As per the conditions of MS1180, the applicant was required to undertake an intrusive acid sulfate soils investigation in accordance with the requirements of DWER's guideline on the <i>Identification and investigation of acid sulfate soils and acidic landscapes</i> (DER, 2015a) at least six months prior to ground disturbing activities.</p> <p>Results from the assessment identified presence of ASS within the supratidal zones between Site C and Site F. If ASS is disturbed during the proposal, it is to be treated and managed in accordance with the requirements the guideline on the <i>Treatment and management of soil and water in acid sulfate soil landscapes</i> (DER, 2015c) as per condition 7-2.</p> <p>For the scope of the activities under the assessment of this licence amendment, the potential risks would involve the crushing, screening and stockpiling of any potential ASS material and handling of ASS material during this process. The Surface Water Management Plan (SWMP), required by condition 8-2 of MS1180 includes measures that will manage against ASS risk during these activities. This includes the requirements below:</p> <ul style="list-style-type: none"> • stockpiles identified to be ASS contaminated to be located on a crushed limestone 300 mm thick layer with a bunded guard of 150 mm high and will be managed in accordance with CEMP Erosion, Sediment and Surface Water Management Protocol; • neutralising and treatment of any stockpiles that may contain ASS; • ASS can be stockpiled for up to 70 hours before soil must be treated; • capture and management of leachate, treatment of stockpile with lime to neutralise material that will be stockpiled for longer than 70 hours; and • restrictions on the re-use of treated ASS material to have a field soil pH of +/-0.5 when compared to field soil pH naturally occurring in background levels. <p>Given the requirements above, and that the indicated cut and fill locations associated with the proposed crushing and screening activities are outside the ASS risk areas (as shown in Figure 2 and Figure 3), the risk of direct disturbance of ASS is not considered significant.</p>

<p>Surface water (Conditions 8-1 to 8-7)</p>	<p>Conditions of MS1180 require the implementation of the proposal to maintain the hydrological regimes and quality of surface water so that environmental values are protected.</p> <p>The confirmed Surface Water Management Plan (SWMP) required by condition 8-2 contains requirements regarding management of water from disturbed areas and stockpiles with the following controls:</p> <ul style="list-style-type: none"> • construction of sedimentation controls such as batters and cut-off drains throughout site; • diverting clean surface water from upstream of the works; • use of sediment traps, silt fences and other control structures; • developing site specific Erosion and Sediment Control Plans for each site within the development area; <i>implemented around stockpiles to limit contaminated run-off</i>; • prepare stockpiles prior to rainfall or potential flood events; and • surface water monitoring points located around Site C and Site F to be sampled monthly (during construction works) for metals, nutrients and physical parameters. • Quarterly groundwater monitoring at locations within Site C and Site F for metals, nutrients, TRH, BTEX and physical parameters. <p>Aspects of the SWMP also detail the management of hydrocarbon emissions that considered relevant in managing the crushing and screening activities, such as requirements to manage spills during refuelling activities. The SWMP includes controls relevant to the management of chemicals and hydrocarbons such as:</p> <ul style="list-style-type: none"> • accidental spills prevented where possible and emergency response actions to remediate accidental spills; • maintain and keep spill kits in areas designated for refuelling activities; • proposed bunding and storage (110% containment) for fuels/chemicals; • containment bunding around vehicle servicing facilities, chemical/fuel storage areas; and • commitments that potentially contaminated stormwater (e.g. runoff which contains hydrocarbons) will not be discharged into the environment.
<p>Greenhouse gas emissions (Conditions 3-1 to 3-11)</p>	<p>Conditions of MS1180 require the proponent to:</p> <ul style="list-style-type: none"> • take measures to ensure that net greenhouse gas emissions do not exceed a series of tapering volumes of CO_{2-e} tonnes, up until 1 July 2049 when net zero tonnes of CO_{2-e} emissions must be achieved, as specified in conditions 3-1 and 3-2; and • not undertake the commencement of Ground Disturbing Activities until the CEO has confirmed in writing that the revised Greenhouse Gas Management Plan satisfies the requirements of conditions 3-3 and 3-4 which has since been submitted and approved. <p>The proponent is required to continue implementing the most recent version of the Greenhouse Gas Management Plan until the emissions specified in condition 3-1 are achieved.</p>
<p>Light management (Conditions 10-1)</p>	<p>The conditions of MS1180 require the applicant to avoid, where possible, and otherwise use best practice technology and risk-based management actions to minimise nightglow and light overspill from the proposal so that the environmental values of amenity at sensitive locations, including, but not limited</p>

to 10-7)	to Hearson Cove and Deep Gorge, are protected. The applicant is required to implement a Light Management Plan that the CEO has confirmed satisfies the requirements of condition 10-2.
----------	---

In accordance with DWER's *Guidance Statement: Setting Conditions* (DER, 2015b), conditions of a Part V licence must not be "...contrary to, or otherwise than in accordance with, an implementation agreement or decision under Part IV of the EP Act." Further, that conditions "will not unnecessarily duplicate requirements imposed on licensees directly by the EP Act or another written law."

In granting the amended licence, the Delegated Officer has taken into consideration conditions applied under Part IV of the EP Act through MS1180, and DWER's *Guidance Statement: Setting Conditions* and determined that the following environmental factors are managed through the Ministerial Statement (MS1180) and therefore require no further regulation under the Part V licence:

- Flora and vegetation, including impacts from dust and changes to surface water quality and/or groundwater regimes;
- Terrestrial fauna, including impacts from dust, noise and vibration;
- Greenhouse gas emissions;
- Hydrogeological and surface water management;
- Groundwater protection;
- Acid sulfate soils; and
- Light management.

Due to the conditions applied through MS 1180 and the requirements of the relevant management plans, the Delegated Officer has determined that duplication of controls to manage impacts associated with the proposed crushing and screening activities are not required within the conditions of this licence.

The EPA's Assessment Report 1705 identified that there is a requirement for air emissions from the proposal to be regulated by the DWER under Part V of the EP Act on the provision that Part V regulation is not inconsistent with the Part IV conditions. In this regard, the assessment of crushing and screening activities as part of this licence application has considered the risk of dust emissions as part of construction activities (specifically category 12 screening activities), the duration of these activities and the proposed controls.

3.2 Rock art significance and potential impacts

Murujuga (the Dampier Archipelago, including the Burrup Peninsula and surrounds) is a unique ecological and archaeological area containing one of the largest collections of Aboriginal engraved rock art (petroglyphs) in the world. The rock art is of continuing cultural, archaeological and spiritual significance for Aboriginal people and also has significant state, national and international heritage value.

The Western Australian Government is committed to the ongoing protection of Murujuga's rock art and is working in partnership with the Murujuga Aboriginal Corporation (MAC), representing the Traditional Custodians of Murujuga, to protect and manage this important area.

The department recognises the cultural importance and heritage value of rock art both internationally and locally and is committed to conducting further detailed scientific investigations and continuing the coordinated approach involving implementation of the Murujuga Rock Art Strategy (MRAS) and Murujuga Rock Art Monitoring Program (MRAMP).

The results from the monitoring program will identify relevant environmental quality indicators

and define acceptable and unacceptable environmental quality conditions, therefore providing data for measuring and assessing environmental performance against environmental quality criteria.

3.3 Exclusions

The scope of this assessment is limited to category 12 screening activities only, and only the operation of an additional crushing and screening circuit. No change to the daily or annual production throughput is proposed. Activities relating to the construction of the broader urea plant are the subject of a separate works approval (W6875/2023/1), granted on 25 June 2024. Activities authorised under works approval W6875/2023/1 include Categories 31, 52, 58, 73 and 85.

4. Risk assessment

The department assesses the risks of emissions from prescribed premises and identifies the potential source, pathway and impact to receptors in accordance with the *Guideline: Risk Assessments* (DWER 2020).

To establish a risk event there must be an emission, a receptor which may be exposed to that emission through an identified actual or likely pathway, and a potential adverse effect to the receptor from exposure to that emission.

4.1 Source-pathways and receptors

4.1.1 Emissions and controls

The key emissions and associated actual or likely pathway during premises construction and operation which have been considered in this decision report are detailed in Table 5.

The table also details the control measures the applicant has proposed to assist in controlling these emissions, where necessary.

The proposed new crushing and screening equipment will be fitted with the same dust suppression systems as existing equipment (i.e. sprays, hoods, etc.) and will be subject to existing operational controls as outlined in Table 5.

Table 5: Proposed applicant controls during operation of crushing and screening plant

Emission	Sources	Potential pathways	Proposed controls
Operation			
Dust	Crushing and screening vehicle movements, lift off from stockpiles and earthworks	Air / windborne pathway	<p>Additional equipment will be operated for a short term only (approximately 2 months).</p> <p><u>Proposed operational controls:</u></p> <ul style="list-style-type: none"> • Utilisation of developed Construction Dust Management Procedure; • 2 x 60,000 litre water supply tanks, 4 x 12,000 litre dust suppression trucks and 8 additional sub-contractor operated water carts of similar capacity; • Water carts available at the site for dust suppression during establishment of the crushing and screening plant and will be operated as required to wet stockpiles and

Emission	Sources	Potential pathways	Proposed controls
			<p>prevent any visible dust from leaving the site;</p> <ul style="list-style-type: none"> Dust suppression water used throughout the premises and for the operation of crushing and screening plant is not extracted from groundwater but rather potable water is carted on site for this purpose; Excavated material will be stockpiled to 5m in height near the mobile crushing and screening plant and a maximum of three stockpiles at each site (6 in total at premises); Crushing and screening equipment will not be operated within 100m of cultural heritage sites; Water systems will be used as required to minimise the generation of dust at material transfer points, crusher and at the material stockpiles; Dust suppression sprays installed at material transfer locations on the jaw crusher, cone crushers, triple deck screen and product stackers; Partial enclosure of stacker track and cone crusher transfer points; Chemical dust suppressants or water trucks utilised on roads to minimise dust generation; Vehicle speeds reduced where necessary to reduce dust liftoff; <p><u>Controls as required by other plans:</u></p> <p>Implementation of the CEMP Air Quality Management Protocol which involves requirements for dust suppression (with water systems, water carts and chemical dust suppressants) and decrease of vehicle speeds to reduce dust generation.</p> <p>Preparation and implementation of the CEMP Construction Dust Management Procedure (required by the CEMP Air Quality Management Protocol) that includes measures conditioned in works approval W6630/2021/1 and the requirements for dust monitoring:</p> <ul style="list-style-type: none"> 6 dust deposition monitoring gauges (installed) located near the sensitive receptors within the prescribed premises; Installation of 4 dust monitors (a telemetry network of 'near real-time' data using ETS Tp-2510 Dust Concentration Sensors) to monitor PM₁₀ and PM_{2.5} data as a 10min average µg/m³ value; <p><u>Licence Holders additions to monitoring plan:</u></p>

Emission	Sources	Potential pathways	Proposed controls
			<ul style="list-style-type: none"> A proposed trigger value of 80 µg/m³ will alert supervisory/management staff to implement management actions including: <ul style="list-style-type: none"> increase to dust suppression activities; reducing work on site to only essential tasks, decreasing speed of plant and movement of equipment and potentially ceasing work during excessively high readings; monitoring of levels until there is no longer an exceedance; and identification of high-risk weather conditions (faster winds / warmer temperature).
Noise	Crushing of material, vehicle movements, reverse beeping		<ul style="list-style-type: none"> All plant will be equipped with exhaust mufflers from the Original Equipment Manufacturer (OEM) or systems meeting or exceeding the OEM specifications; Works carried out during daylight hours; <p>CEMP Noise Management Protocol, required by conditions of MS 1180 include following relevant measures:</p> <ul style="list-style-type: none"> Equipment fitted with appropriate noise reduction devices; Regularly inspect, maintain and replace mobile equipment; and Broadband reversing alarms installed on mobile plant.
Sediment laden stormwater ¹	Crushing and screening of material Material stockpiles	Overland run off	<p>Earthen bund constructed around the plant area at Site F to prevent surface water ingress into the premises and prevents surface water runoff from crushing and screening plant and associated processed material stockpiles;</p> <p>Conditions of Ministerial Statement 1180 require management of surface water via the implementation of the Surface Water Management Plan.</p>
Hydrocarbons ¹	Screening and crushing plant Refuelling equipment Machinery maintenance	Direct spill to land; and Contaminated surface/ stormwater and leachate	<p>Implementation of the Hydrocarbons and Hazardous Substances Management Protocol (HHSMP) that include measures:</p> <ul style="list-style-type: none"> Chemicals stored on or within a bunded structure; In the event of a spill, the spill will be contained using spill kits available, removed and soil contaminated by spills will be removed to an appropriate stockpile location for remediation; No vehicle or mobile plant refuelling shall occur

Emission	Sources	Potential pathways	Proposed controls
			<p>within 50m of a watercourse or intertidal zone.</p> <ul style="list-style-type: none"> Servicing of mobile plant will be conducted within an earthen bunded area; All minor volumes of chemicals will be stored on or within a bunded structure with capacity 110% of largest container, or 25% of the total storage capacity of all containers (whichever is larger), impermeable walls and floor (soil floors are not sufficient) and roofed in accordance with <i>Australian Standard AS1940:2004 – The storage and handling of flammable and combustible liquids</i>; Chemicals, oily or contaminated products that are no longer required to be removed from site by licenced controlled waste contractor. Hazardous waste material and dangerous goods to be disposed of in accordance with the relevant legislation at approved and certified facilities; Drip trays will be placed under the fuel delivery vehicle, the plant / machinery being refuelled and any joins in fuel delivery hoses to capture any spills or leaks associated with the refuelling process. <p>Conditions of Ministerial Statement 1180 require management of hydrocarbons under the implementation of the Surface Water Management Plan.</p>
Artificial Light ¹	Crushing and screening plant Vehicle movements	Air pathway	<ul style="list-style-type: none"> Only operated during day light hours <p>Conditions of Ministerial Statement 1180 require management of artificial light overspill under the implementation of the Light Management Plan.</p>

Note 1: Refer to Table 3 for the relevant requirements and management of specified emissions as part of Part IV assessment and conditioning under MS1180.

4.2 Receptors

In accordance with the *Guideline: Risk Assessment* (DWER 2020), the Delegated Officer has excluded the applicant's employees, visitors, and contractors from its assessment. Protection of these parties often involves different exposure risks and prevention strategies and is provided for under other state legislation.

Table 6, Figure 7 and Figure 8 below provides a summary of potential human and environmental receptors that may be impacted as a result of activities upon or emission and discharges from the prescribed premises (*Guideline: Environmental Siting* (DWER 2020)).

Table 6: Sensitive human and environmental receptors and distance from prescribed activity

Human receptors	Distance from prescribed activity
Neighbouring industrial premises (zoned strategic industry City of Karratha Planning Scheme No.8)	Immediately adjacent to the Premises – Yara Pilbara Fertiliser; and Business Park. King Bay Supply Base – 130m south of port Woodside Energy (Pluto LNG) 1.2km east
Ngajarli (Deep Gorge) (recreational site)	1 km southeast of the Site C boundary
Hearson's Cove: a popular public recreation and fishing beach	Approximately 2 km east of the premises boundary (Sites C& F)
Dampier Townsite	Approximately 5.4 km south-west of the premises boundary
Karratha Townsite	11.5 km SSE Considering the distance of category 12 activities to this receptor, the Delegated Officer considers that impacts to this receptor are not foreseeable and therefore is not further considered in the risk assessment.
Environmental receptors	Distance from prescribed activity
Murujuga National Park	Directly south and east of the project site
Tidal flat	Between sites C and F
Ephemeral creeks	Within the premises boundary
Aboriginal and other heritage sites	Within and adjacent to the premises boundary
Threatened/Priority Fauna	27 conservation significant fauna species have been identified as being "known to occur" or are considered "likely to occur" within a 10km buffer of the Project area. This includes the Ghost Bat (<i>Macroderma gigas</i>), Northern Quoll (<i>Dasyurus hallucatus</i>) and Olive Python (<i>Lialis olivaceus barroni</i>). 32 migratory bird species are also known to, or likely to occur within the project area 10km buffer, of which five are listed as threatened species. Another two bird species, the Bar-tailed Godwit (Baueri) (<i>Limosa lapponica baueri</i>) and Northern Siberian Bar-tailed Godwit (<i>Limosa lapponica menzbieri</i>), are also listed as threatened but are not considered to be migratory. Due to the nature of the Category 12 activities in this assessment and regulation under MS 1180, these receptors are not further considered in the risk assessment.
Threatened/Priority Flora	Three priority species have been recorded within 5km of the project; <i>Terminalia supranitifolia</i> (Priority 3), <i>Stackhousia clementii</i> (Priority 3) and <i>Rhynchosia bungarensis</i> (Priority 4). Due to the nature of the Category 12 activities in this

	<i>assessment and regulation under MS 1180, these receptors are not further considered in the risk assessment.</i>
Threatened Ecological Communities and Priority Ecological Communities	<p>Several priority ecological communities have been identified in the area. Priority 1 ecological communities exist within 5 km of the premise including the Burrup Peninsula rock pool and rock piles communities. The Burrup Peninsula rock pile communities consist of short-range endemic land snails.</p> <p><i>Considering the distance of category 12 activities to this receptor, the Delegated Officer considers that impacts to this receptor are not foreseeable and therefore are not further considered in the risk assessment.</i></p>
Groundwater	<p>Flows towards tidal flat with water levels close to surface (1m close to tidal zone). pH neutral (6.5 – 7.7) with EC ranging from 5,200 – 190,000 µS/cm.</p> <p>Site F - between 10.8 – 7.7 metres below ground level (mbgl)</p> <p>Site C - between 10.2 – 7 mbgl</p>

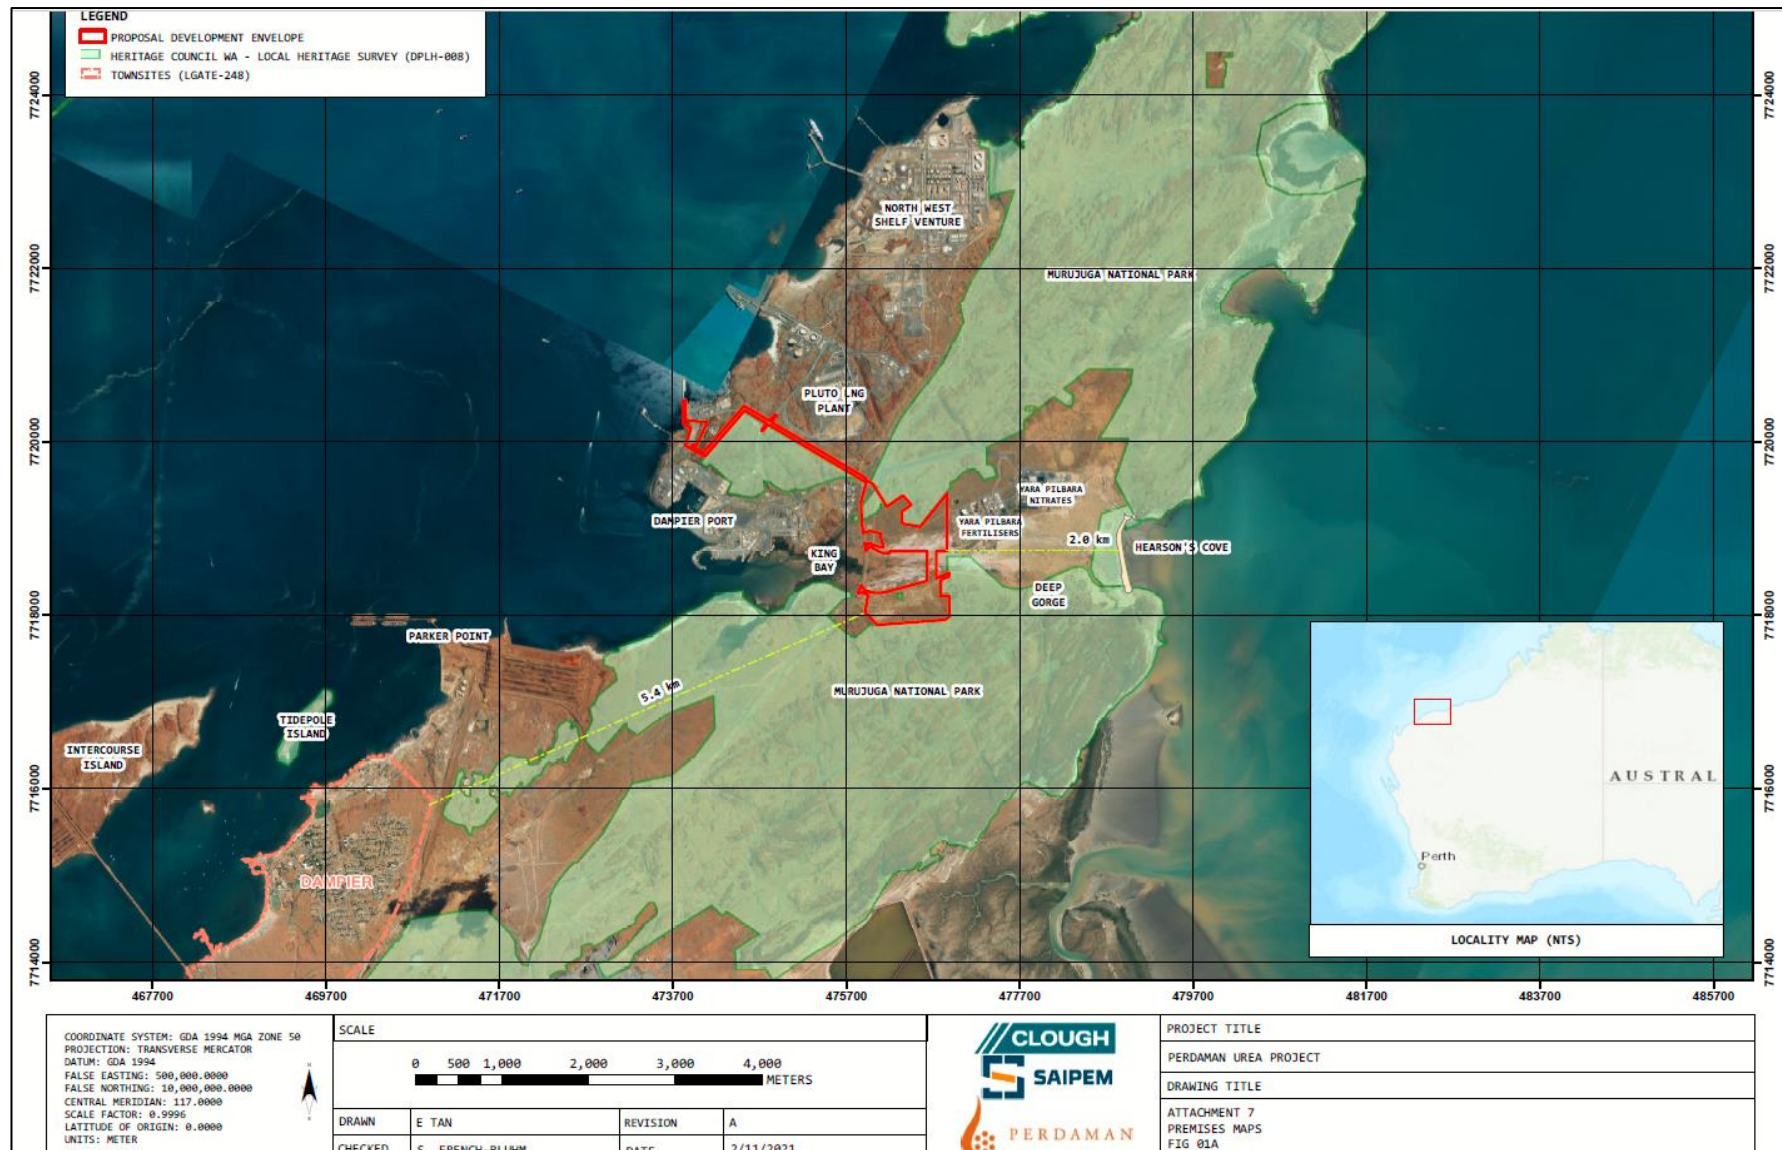

Figure 7: Distance to sensitive receptors, including recreational areas

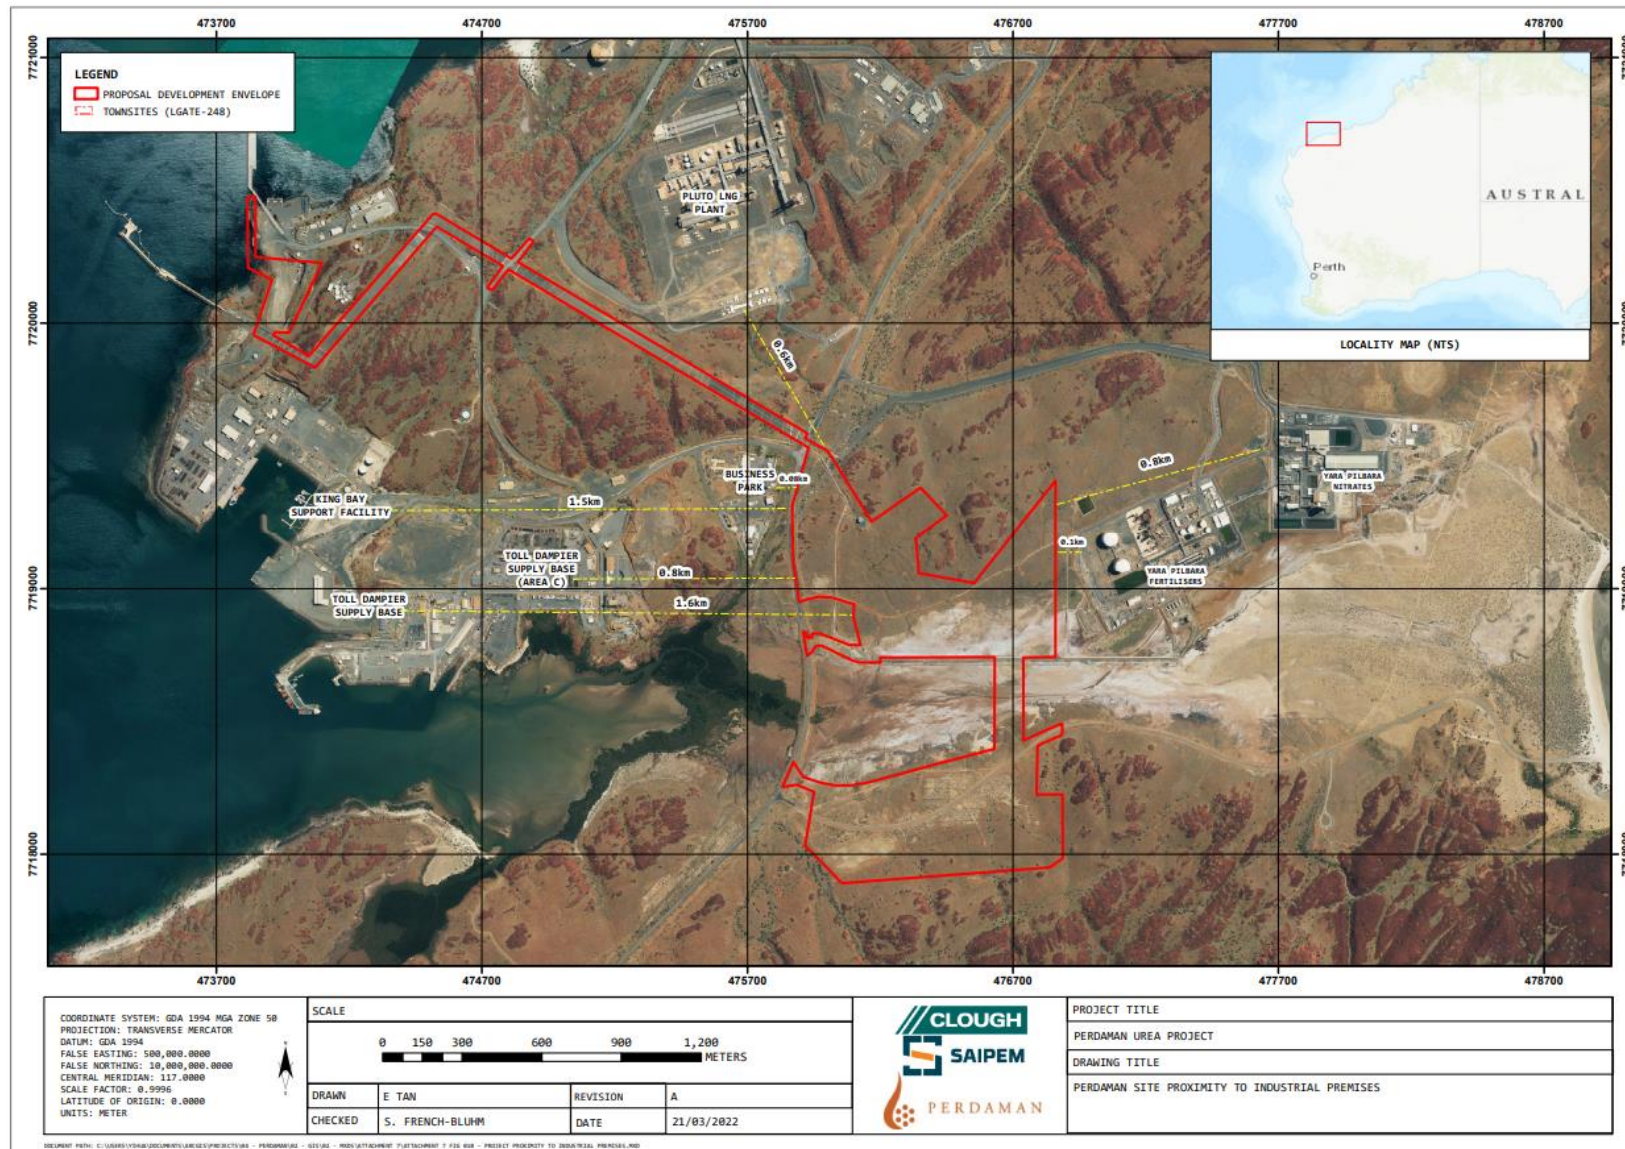

Figure 8: Distance to industrial receptors

4.3 Risk ratings

Risk ratings have been assessed in accordance with the *Guideline: Risk Assessments* (DWER 2020) for each identified emission source and takes into account potential source-pathway and receptor linkages as identified in Section 4.1. Where linkages are in-complete they have not been considered further in the risk assessment.

Where the applicant has proposed mitigation measures/controls (as detailed in Section 4.1), these have been considered when determining the final risk rating. Where the Delegated Officer considers the applicant’s proposed controls to be critical to maintaining an acceptable level of risk, these will be incorporated into the works approval as regulatory controls.

Additional regulatory controls may be imposed where the applicant's controls are not deemed sufficient. Where this is the case the need for additional controls will be documented and justified in Table 7.

Licence L9426/2024/1 that accompanies this decision report authorises emissions associated with the operation of the premises i.e. screening and crushing activities

The conditions in the issued licence, as outlined in Table 7 have been determined in accordance with *Guidance Statement: Setting Conditions* (DER 2015b).

Table 7: Risk assessment of potential emissions and discharges from the premises during operation

Risk events					Risk rating ¹ C = consequence L = likelihood	Licence Holder controls sufficient?	Conditions ² of licence	Justification for regulatory controls
Sources / activities	Potential emission	Potential pathways and impact	Receptors	Licence Holder controls				
Operation								
Screening, crushing, unloading, loading and storage of material Vehicle movements	Dust (granophyte /sand/alluvium material)	Pathway: Air / windborne pathway Impact: Health and amenity impacts	Neighbouring industrial sites adjacent to premises Residential receptors at Dampier Townsite 5.4km away Recreational users of Ngajarli and Hearson's Cove	Refer to Section 4.1.1	C = Slight L = Unlikely Low Risk	Y	Condition 2 (Table 2): dust sprays and dust suppression Condition 4, 7, 8 and 9: Dust monitoring and management	<p>The Delegated Officer has determined that operation of an additional crushing and screening plant does not alter the risk profile associated with dust impacts on visitors to the area. The average daily throughput will remain at 5,000 tonnes (per current Licence conditions) and therefore visitors are not expected to be exposed to inhalable particulate concentrations beyond occupational exposure standards (Safe Work Australia, 2022) even during upset conditions. Noting the distances to residential receptors, risks to these receptors is also considered to remain unchanged.</p> <p>Operational controls associated with dust management remain in place for existing infrastructure and will also apply to the additional crushing circuit. These include the application of dust mitigation measures (dust suppression), dust monitoring and implementation of additional controls in response to exceedances of the dust management trigger.</p> <p>No additional regulatory controls are required beyond those conditioned.</p>
		Pathway: Air / windborne pathway and deposition of particulate matter on rock art Impact: Causing erosion through abrasion	Petroglyphs - within and immediately adjacent to premises boundary	Refer to Section 4.1.1	C = Severe L = Unlikely High Risk	N	Condition 2 (Table 2): plants to be operated >100 m from heritage sites; Condition 2 (Table 2): dust sprays and dust suppression <u>Condition 2 (Table 2): dust sprays and dust suppression</u> Condition 3: Production limits Condition 4, 7, 8 and 9: Dust monitoring and management Condition 8: specifies location of portable monitor Condition 8: Trigger exceedance investigation and response Condition 10: ambient meteorological monitoring	<p>The Delegated Officer notes that Licence L9426/2024/1 granted in March 2024 (and subject to Appeal 016/2024) authorised the operation of up to three crushing units at the premises across Site C and Site F with a combined daily throughput of 5,000 tonnes. As this proposed amendment involves the operation of only two plants without increasing the daily throughput, the Delegated Officer considers the risk of dust impacts is unlikely to differ significantly from what that assessed under previous versions of the Licence and the operation of an additional crushing and screening plant on the premises (to the one plant currently authorised) will not change the overall risk profile of Category 12 activities relating to impacts on rock art.</p> <p>The Delegated Officer has determined that the consequence of this impact remains to be severe, the highest rating, in recognition of the high conservation and cultural value of the rock art, as well as the uncertainty of the impacts caused by dust emissions to rock art and in the absence of interim guidelines from the MRAMP.</p> <p>The likelihood for the risk event (unlikely) is unchanged from that previously assessed for Category 12 activities on the premises. In making this determination the Delegated Officer has considered the following:</p> <ul style="list-style-type: none">that the daily and annual throughput limits and operational dust controls remain unchanged and will apply to both new and existing plant;the proposed additional plant is equivalent to that previously authorised to operate at Site C;that the operation of the additional plant will be limited to a short duration of about 2 months; andthat operations will continue to be limited to Site F only. <p>The Delegated Officer considers that while the amendment will result in the operation of additional plant, this can be largely managed in accordance with existing Licence conditions relating to infrastructure controls and dust monitoring, and supported by conditions of MS1180.</p> <p>To ensure that adequate dust control and dust suppression is available on the premises, and to align with recent dust control improvements on works approval W6946/2024/1/ for port side crushing and screening activities, the Delegated Officer has included additional specifications regarding the use of water fogging units to supplement existing controls. This additional detail and specification is considered sufficient to mitigate any additional dust loading that may be created during the remaining crushing and screening activities at the premises. Existing monitoring requirements specified on licence are considered to be suitable for capturing activities associated with the additional plant noting it will be co-located on Site F with existing operational infrastructure.</p> <p>Controls specified within the Flora Management Plan and the Cultural Heritage Management Plan (as required by conditions of MS1180) will continue to support the mitigation of the impact of dust emissions to rock art.</p>

Risk events					Risk rating ¹	Licence Holder controls sufficient?	Conditions ² of licence	Justification for regulatory controls			
Sources / activities	Potential emission	Potential pathways and impact	Receptors	Licence Holder controls	C = consequence L = likelihood						
	Noise	Pathway: Air / windborne pathway Impact: Health and amenity impact	Neighbouring industrial sites adjacent to premises Residential receptors at Dampier Townsite 5.4km away	Refer to Section 4.1.1	C = Slight L = Unlikely Low Risk	Y	Condition 2 (Table 2): plant operated with exhaust mufflers.	<p>The Delegated Officer considers that although operation of additional plant may increase overall noise emissions associated with Category 12 activities, the risk associated with noise impacts remains unchanged (low risk), due to the short term nature of the activities and the distance to residential receptors. It is expected that noise emissions associated with crushing and screening activities will not significantly increase above historical noise levels.</p> <p>The Delegated Officer has determined that the requirements of the existing Licence and the <i>Environmental Protection (Noise) Regulations 1997</i> continue to be sufficient for managing risks associated with noise.</p>			
	Hydrocarbons (associated with operational activities – equipment, machinery, generators)	Pathway: Overland transport via contaminated stormwater Impact Ecosystem disturbance of impacting surface water quality	Ephemeral creek within the premises Tida flats between Site C and site F	Refer to Section 4.1.1			Condition 2 (Table 2): plants to be only operated within bunding	<p>The Delegated Officer considers that there will be no change to the emissions profile associated with hydrocarbon storage and handling, stormwater, ASS and light overspill as a result of operating an additional crushing and screening circuit on the premises. Existing operational controls will apply to the new equipment (which will be co-located with existing plant on Site F) and are considered suitable for managing the associated risks.</p> <p>The Delegated Officer remains of the view that the requirements of the existing Licence and MS 1180 (and associated management plans) are sufficient for managing risks associated with hydrocarbons, stormwater, ASS and light overspill.</p> <p>Further details of the Delegated Officer's consideration of regulatory controls are provided in the Decision Report associated with the Licence granted on 19 March 2024.</p>			
		Pathway: Leaching through soil profile Impact: Contamination of groundwater	Shallow groundwater Site F (between 10.8 –7.7 mbgl) Site C (between 10.2 – 7 mbgl)	Refer to Section 4.1.1			N/A				
	Sediment laden stormwater	Pathway: Overland runoff potentially Impact: Ecosystem disturbance or impacting surface water quality	Ephemeral creek within the premises Tida flats between Site C and site F	Refer to Section 4.1.1			Condition 2 (Table 2): plants to be only operated within bunding				
	Leachate from disturbed acid sulphate soils	Pathway: Overland transport Impact Ecosystem disturbance of impacting surface water quality	Ephemeral creek within the premises Tida flats between Site C and site F	Refer to Section 4.1.1			N/A				
		Pathway: Leaching through soil profile Impact: Contamination of groundwater	Shallow groundwater Site F (between 10.8 –7.7 mbgl) Site C (between 10.2 – 7 mbgl)	Refer to Section 4.1.1							
	Light overspill	Pathway: Air pathway Impacts: Amenity at nearby recreational areas	Recreational users of Ngajarli and Hearson's Cove	Refer to Section 4.1.1			N/A				
		Pathway: Air pathway Impacts: Disruption to fauna activity and behaviour	Environmental receptors in King Bay	Refer to Section 4.1.1			N/A				

Note 1: Consequence ratings, likelihood ratings and risk descriptions are detailed in the *Guideline: Risk Assessments* (DWER 2020).

Note 2: Proposed applicant controls are depicted by standard text. **Bold and underline text** depicts additional regulatory controls imposed by department.

5. Consultation

Table 8 provides a summary of the consultation undertaken by the department. Stakeholders listed below advised of the proposal on 23 April 2025.

Table 8: Consultation

Consultation method	Comments received	Department response
Application advertised on the department's website on 23 April 2025.	Comments were received from the Conservation Council Western Australia (CCWA) on 13 May 2025 objecting to the approval of the amendment application. A summary of comments is provided in Appendix 2.	Refer to Appendix 2.
City of Karratha	The City of Karratha confirmed that the development the subject of the proposed licence amendment application is to comply with the Development Approval issued by the Regional Joint Development Assessment Panel (JDAP) on 17 March 2022, and the conditions of that development approval	Noted.
Department of Jobs, Tourism, Science and Innovation (JTSI) and Department of Planning Lands and Heritage (DPLH)	None received.	N/A
Friends of Australian Rock Art (FARA)		
Murujuga Aboriginal Corporation (MAC)		
The Save Our Songlines group		
Licence Holder provided draft licence and amendment report on 26 May 2025 and responded on 28 May 2025.	No changes were requested and Licence Holder waived the remainder of the comment period.	N/A

6. Conclusion

Based on the assessment in this decision report, the Delegated Officer has determined that the operation of an additional crushing and screening circuit will not alter the risk profile of the premises, and that this activity can be generally managed under the existing conditions of the licence and MS1180. In making this decision the Delegated Officer notes that the additional crushing and screening circuit will not result in a change to the current daily or annual throughput limits specified on the Licence. The Delegated Officer has also considered that the additional unit is only expected to operate for a short duration (2 months) to supplement shortfalls in production needed to complete crushing and screening works by the Minister's imposed cessation date of 31 July 2025.

6.1 Summary of amendments

Table 9 provides a summary of the proposed amendments and will act as record of implemented changes. All proposed changes have been incorporated into the Revised Licence as part of the amendment process.

Table 9: Summary of licence amendments

Condition no.	Proposed amendments
1 (Table 1)	Amended to include additional crushing and screening equipment.
2 (Table 2)	Condition n) updated to provide clarity regarding the allowable daily throughput.
2 (Table 2)	Condition part c) and d) inserted into table to include requirements and specifications regarding supplementary fogging systems.

Appendix 2: Application submission summary

Summary of submission points	DWER comments
It was noted that the maximum throughput of 1,300,00 tonnes, at a daily average of 5,000 tonnes, is 260 days, or over 8 months. There is concern that even with increased crusher capacity, it is not feasible that crushing activities will meet the time limit set by the Minister for cessation of activities by 31 July 2025.	The Delegated Officer notes that the application is not seeking to process an additional 1,300,000 tonnes of material by 31 July 2025; the operational end date determined by the Minister as a result of Appeal 016/2024. The Licence Holder has advised that as of 19 March 2025, it is estimated that about 482,000 tonnes of material remains on the premises to be processed through the crushing and screening plant. The Application states that current production rates are much less than the authorised daily throughput of 5,000 tonnes and, if the current rates are sustained, processing of material remaining onsite will not be completed by 31 July 2025. As such, an additional crushing and screening plant is necessary to achieve the daily throughputs required to process this remaining material prior to the Minister's imposed cessation date of 31 July 2025. A revised crushing and screening schedule was provided by the Licence Holder outlining these estimates and expected rates of material processing to complete the works by the required end date.
It was acknowledged that the intent of the Minister's decision on the Appeal of the licence (Appeal 016/2024) was to reduce dust impacts on rock art by limiting the operation of the crushing and screening equipment. A Licence Amendment to install another crusher to increase the throughput of crushing operations undermines the intent of the Minister's appeal determination.	As outlined in Table 7, the Delegated Officer considers that the short term (two month) operation of an additional crushing and screening circuit is not expected to alter the risk profile of the premises and that risks associated with dust impacts on rock art can continue to be managed under the existing Licence controls and supported by the requirements of MS1180. In making its determination on risk, the Delegated Officer notes that the proposal will not result an increase in the authorised production throughput (either the daily average throughput or total annual throughput) nor will Category 12 activities be extended beyond Minister's imposed end date of 31 July 2025.
The Licence Amendment will significantly increase the risk of impact to rock art through both increased volume of dust and an increase in the length of the exposure. The department's ability to assess the risks from the increased dust emissions from the Licence Amendment was questioned noting that recent data from the MRAS and MRAMP are not currently available. The air quality management program for the Licence Amendment merely reiterates the conditions of MS 1180 in regard to protection of rock art. However, there is still no recent reporting on whether rock art is being negatively impacted by industrial activities on Murujuga. Without rock art monitoring data being publicly released in timely fashion, it is not possible to determine whether current industrial emissions are impacting rock art, or which industries are having the greatest impact.	The Delegated Officer has also had consideration for previous assessments of dust risk. It is noted that the initial Licence (L9426/2024/1 granted in March 2024) authorised the operation of up to three crushing plants across both Site C and Site F with a combined daily throughput of 5,000 tonnes. The Licence was the subject of Appeal 016/2024 whereby the Minister's review of dust risks resulted in the imposition of the condition requiring all Category 12 activities to cease by 31 July 2025. The Licence amendment application is seeking authorisation for the operation of only two plants for a short period of time (two months) and without increasing the daily throughput. Noting this, and that operational controls relating to the management of dust remain unchanged, the Delegated Officer considers the risk of dust impacts is unlikely to differ significantly from what that assessed under previous versions of the Licence and can continue to be managed in accordance with existing regulatory controls applied on the Licence and MS1180.
